

During this first week I have focused on learning Scrum and how you apply it to a project. I feel that there are still things for me to learn about, therefore it will be one of my focuses next week as well. Furthermore, next week I want us as a team to have our project/product fully specified and preferably we have created our product backlog. As I handle the communication with our stakeholders, I will make sure to get them to collaborate with us during this initial planning phase so that we can have an extensive specification of the product as early as possible.

I feel that I don't really have anything to teach my team members at this time in the project. Instead I noticed that some of our members had good knowledge in how to use Trello and Github so I proposed that they hold small workshops for the rest of the team. My idea with this was that we would establish a standard and common way of working with these tools early on.

So far I have taken on the role as product owner and scrummaster. We as a group felt that this was a good idea during the first phase of the project as I am in contact with the stakeholders. Other contributions towards our use of Scrum is that I am actively trying to learn about the Scrum way of working and hope to apply more of it during next week.

As we have people in the group that seem to be great programmers, more so than I, I will try to soak up as much knowledge as possible during the course. At the same time I really want to develop my skills in regards to leadership, working with stakeholders and executing real software projects.
